FLOW DURATION

AT STREAMFLOW GAGING STATIONS IN PUERTO RICO

By Ferdinand Quiñones, Eloy Colón-Dieppa, and Max Juarbe

ABSTRACT

Flow-duration tables were computed for 78 streamflow continuously gaging stations in Puerto Rico. Mean-daily discharges were used to compute the duration frequencies for the historical period of record of the stations as well as for individual months. The period of record at the gaged sites ranged from 3 to 25 years.

INTRODUCTION

The U.S. Geological Survey, Water Resources Division, has collected streamflow data throughout the island of Puerto Rico since 1959. Streamflow data include determinations of mean-daily discharges at recording stations at the principal streams in Puerto Rico. The data have been published since 1964 in a series of reports denominated "Water Records for Puerto Rico".

The data are stored in the Water Resources Division's National Water Storage and Retrieval System (WATSTORE). The data base can be accessed readily by water users in and outside of the Island through remote terminals located at U.S. Geological Survey District offices. The computerized WATSTORE system provides a variety of statistical programs for the analyses of the data. A flow-duration computation program, including determinations of historical and monthly-duration frequencies, is one of the available programs.

Flow-duration data are used extensively by engineers and hydrologists in many water-related problems. Flow-duration frequencies can assist in the design of water-supply works, in waste-allocation studies, and in low-flow investigations.

In 1983, a project was begun in cooperation with the Puerto Rico Aqueduct and Sewer Authority and the Puerto Rico Environmental Quality Board, to compute and compile in one report historical and monthly flow-duration data. Computations utilizing WATSTORE program A969 were made for each continuous recording gaging station in Puerto Rico, active or inactive, for which 3 or more years of mean-daily discharge records were available. All records available through the 1982 water year (ending on September 30, 1982) were utilized in the computations.

SIGNIFICANCE AND INTERPRETATION OF FLOW-DURATION DATA

Flow-duration data, in the form of curves, have been used since 1924 (Foster, 1924). The methodology on which WATSTORE program A969 is based is described by Searcy (1959). The duration curve is a cumulative-frequency curve that indicates the percent of the time that a particular parameter was equalled or exceeded. Statistically, the flow-duration curve integrates the frequency of occurrence of the parameter described. The duration curve does not indicate any chronological order and technically applies only for the period for which the data used in the analyses were collected. In practice, flow-duration curves are widely used for estimating flow parameters over time and space.

SIGNIFICANCE AND INTERPRETATION OF FLOW-DURATION DATA-Continued

Flow duration curves can be prepared from daily, weekly, monthly or other time period basis of flow determinations. The data points during a given period are arranged according to the magnitude in a range of classes, and the percent of time during which the flow equals or exceeds the specified values is computed. A curve can be drawn through the computed points or the data can be summarized in a table format as in this report.

The following are typical applications of flow-duration data:

1. Computation of suspended-sediment loads utilizing techniques described by Miller (1951).

2. Estimation of long-term flow durations at a gaging station with a short-term record. An index station with long-term flow duration data is necessary (Searcy, 1959).

3. Estimation of statistical variables such as the mean, mode, and median (Cross and Hedges, 1959).

4. Study of basin characteristics on the basis of the shape of the curve (Searcy, 1959).

HISTORICAL AND MONTHLY FLOW-DURATION TABLES

Generally the flow-duration distribution for a station is computed from the maximum number of flow determinations available for the existing period of record. The mean-daily discharges computed from a continuously recording gaging station provides the most satisfactory flow statistics to determine a reliable distribution through the entire flow regime. However, a distribution or curve defined on the basis of the total data points available from the historical record, does not provide information as to time and seasonal effects. The seasonal nature of the streamflow can be investigated from a partial-duration curve based on data points collected during individual months. In a partial-duration curve, all the mean-daily discharges for all of the months of January of record are used to define a January flow-duration curve.

Examples of historical flow-duration curve compared to the partial curves for the individual months are shown in figure 1. The seasonal nature of the flow is evident from the partial-duration curves. During periods of low flow the difference is more significant. The 50 percent duration obtained from the historical curve used in the example is about 110 cubic feet per second (ft^3/s). However, the same duration is only 55 ft^3/s during the dry season (April curve), and 170 ft^3/s during the wet season (October curve).

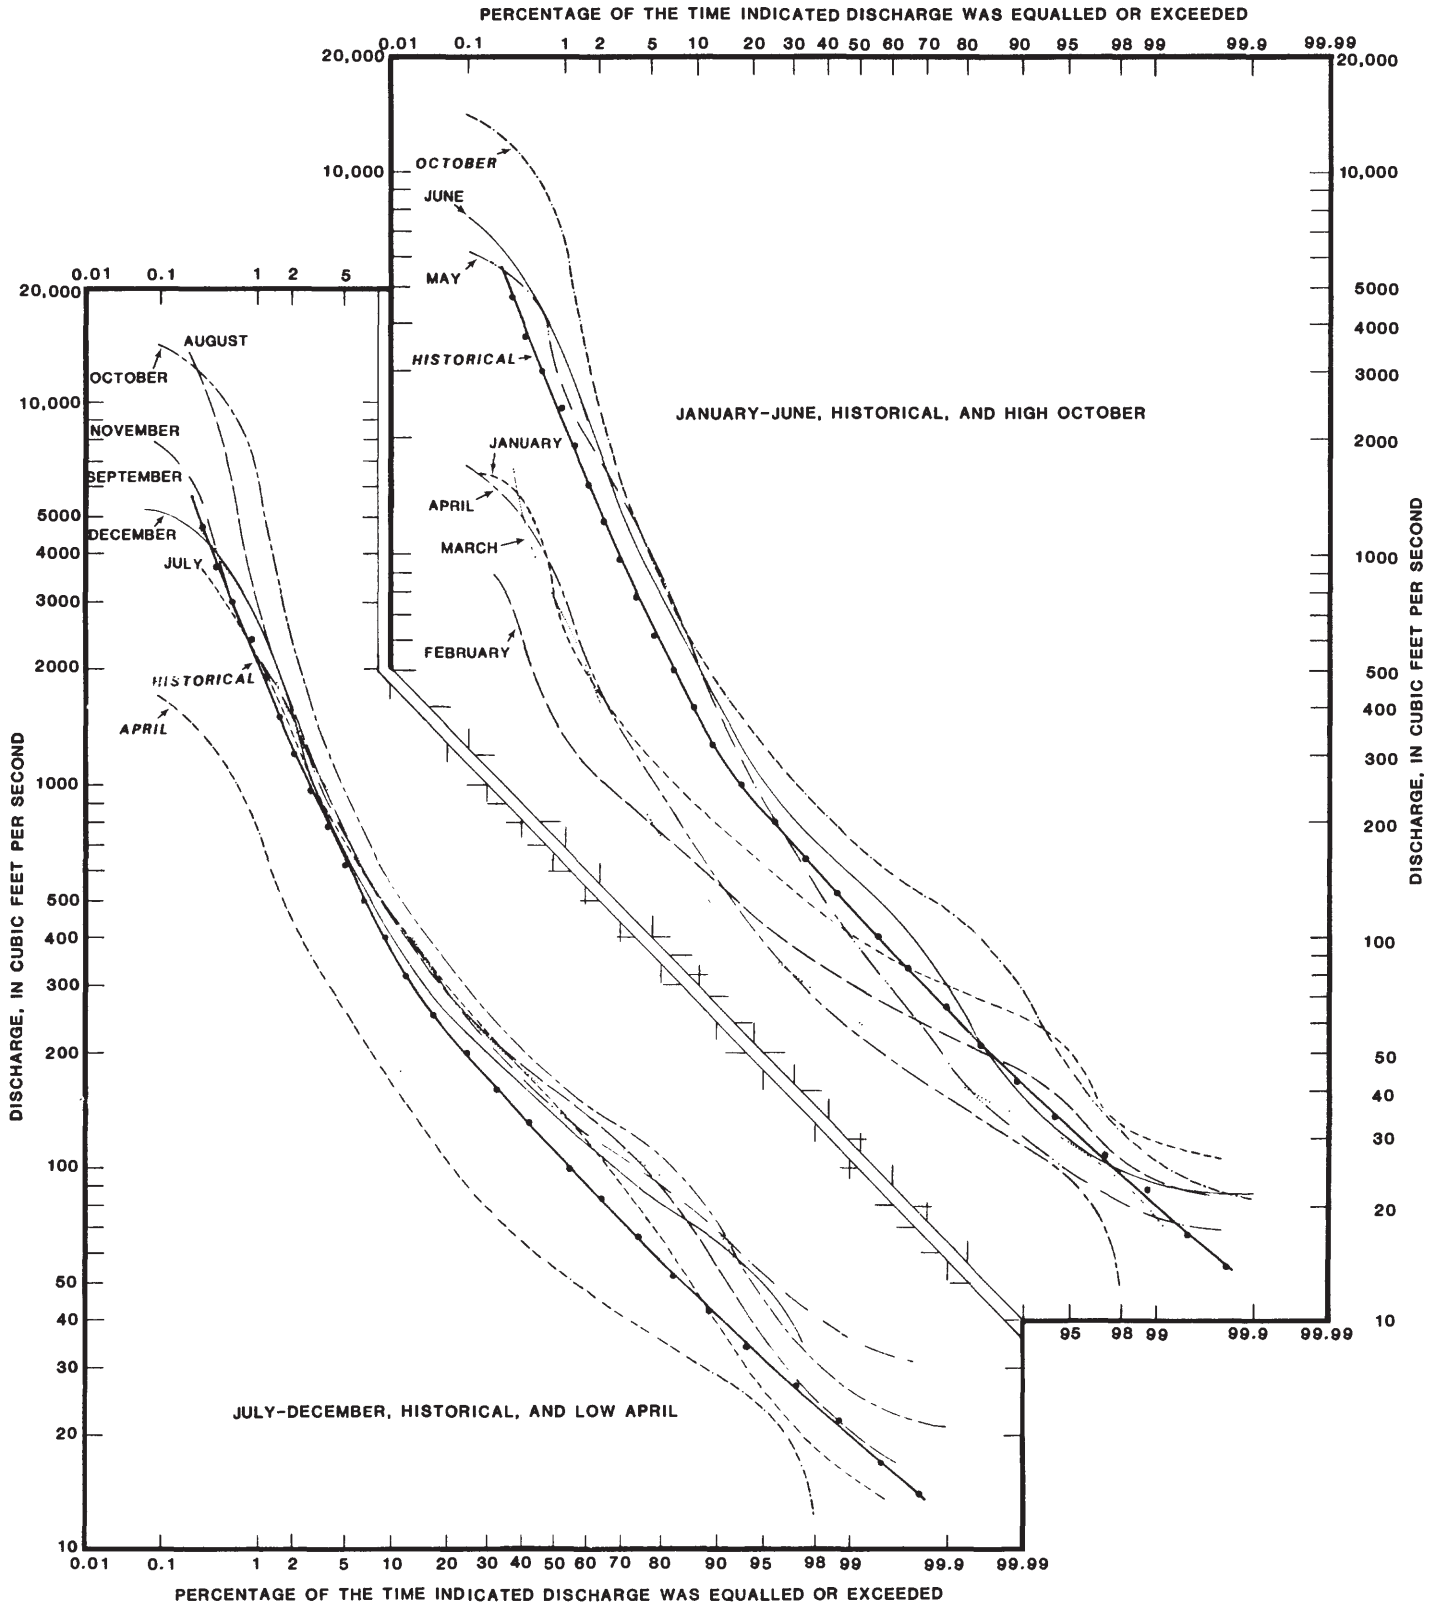

Figure 1.--Flow-duration curves for Rio Grande de Loiza at Caguas, PR (50055000) based on historical mean daily discharges and individual months, 1959-82.

FLOW-DURATION TABLES

The flow-duration frequency tables were prepared for the stations listed in table 1 and are shown in tables 3 to 80. Stations affected by streamflow regulation are shown in table 2. The general location of the stations, referenced to map numbers, are shown in figure 2. Station numbers refer to the system of 8 digits utilized by the U.S. Geological Survey. In this system, the number "50031200" represents a station, where the first two digits ("50") refer to stations in Puerto Rico. The remaining six digits "031200" represent the local station number, based on a numbering system that increases in a downstream order. In Puerto Rico the local numbering system starts in the Río Guajataca basin and increases in a clockwise manner around the Island.

Data listed as prior to 1959 is unpublished data furnished by the Puerto Rico Water Resources Authority, and is on file in the Caribbean District office and in the National Water Data Storage and Retrieval System, Washington, D.C.

Additional data and information on any of the stations described in this report may be available from the Caribbean District office of the U.S. Geological Survey, Water Resources Division, in San Juan, Puerto Rico (tel. 809 753-4414).

N/A - Drainage Area not available

e - Drainage Area estimated

Table 2.--Stations affected by regulation.

STATION NUMBER	DESCRIPTION OF REGULATION (See Table 1)
50020500	Drainage area includes 6.0 square miles above Lago Garzas. Low flow affected by diversion out of Lago Garzas to Rio Guayanes.
50021050	Low flow affected by diversion into the basin upstream from site and also flow is regulated 0.7 miles downstream at Pellejas Dam.
50029000	Low flow affected by regulation at Lago Dos Bocas, 8.3 miles upstream.
50031200	Low flow affected by diversion for water supply, 300 feet upstream.
50031500	Low flow affected by regulation.
50032300	Low flow affected by regulation and diversion.
50032600	Low flow affected by regulation and diversion.
50035000	Low flow affected by regulation and diversion.
50038100	Low flow affected by regulation and diversion.
50039500	Drainage area includes 25.4 square miles not contributing to surface runoff.
50039600	Drainage area includes 25.4 square miles not contributing to surface runoff.
50040000	Low flow affected by diversion for domestic water supply and irrigation.
50043000	Low flow affected by diversion into Cidra Reservior 5 miles upstream.
50046000	Low flow affected by diversion upstream for domestic water supply and irrigation.
50047850	Low flow affected by regulation (at Lago de Cidra) and diversion (at Represa de San Juan) upstream from site.
50048000	Low flow affected by regulation (at Lago de Cidra) and diversions (at Represa de San Juan and Represa de Guaynabo) upstream from site.
50049000	Low flow affected by diversion for water supply 0.4 mile upstream.
50051310	Low flow affected by diversion for water supply at gage.
50071000	Low flow affected by diversion for water supply upstream from gage.
50077000	Low flow affected by diversion for water supply upstream from gage.
50110200	Diversion flow - tunnel outlet.

Table 2.--Stations affected by regulation. (Continued)

STATION NUMBER	DESCRIPTION OF REGULATION (See Table 1)
50111200	Low flow affected by regulation downstream at Lago Guayabal.
50111700	Low flow affected by diversion from Lago Guayabal for irrigation.
50112500	Low flow affected by diversion 0.4 mile downstream.
50114700	Low flow affected by diversions for irrigation at and above gage.
50121000	Low flow affected by regulation and diversion for water supply and irrigation upstream from gage.
50122000	Low flow affected by diversion into the basin and diversion for irrigation upstream from gage.
50125790	Low flow affected by regulation, diversions into the basin, and diversions for irrigation at gage.
50125900	Low flow affected by diversion at gage
50126150	Low flow affected by regulation and diversion in and out of Lago Luchetti upstream from gage and it is also affected by diversion for water supply 300 feet downstream from gage.
50128000	Low flow affected diversions in and out of Lago Luchetti, storage regulations, power development, and diversion for irrigation and municipal use.
50129000	Low flow affected by diversion in and out of Lago Loco and diversions for irrigation upstream from gage.
50129500	Low flow affected by diversion in and out of Lago Loco and diversions for irrigation upstream from gage.
50144000	Drainage area includes 39.7 square miles from headwaters of Lago Yahuecas (17.05 square miles), Lago Guayo (9.67 square miles), Lago Prieto (9.50 square miles), and Lago Toro (3.5 square miles) which does not contribute to surface runoff except at high stages. Low flow affected by diversions out to Rio Yauco.
50145000	Drainage area includes 39.7 square miles from headwaters of Lago Yahuecas (17.05 square miles), Lago Guayo (9.67 square miles), Lago Prieto (9.50 square miles), and Lago Toro (3.5 square miles) which does not contribute to surface runoff except at high stages. Low flow affected by diversions out to Rio Yauco.
